

## 2. SECOND LEVEL

### 2.1 Introduction

We start this level by learning to detect frequencies and signals from a certain distance. Everything in this world exists thanks to the conditions this planet dictates. Our planet provides everything: matter, energy, colors, forms, computers, Wi-Fi etc. – all of these things generate and are some kind of frequency. For example, a cellphone is an object that is a product of the human brain capable of reacting to signals; it generates and receives frequencies. For this cellphone it is irrelevant where the signal is coming from. It is the same with the TV antenna or radio. With these types of devices the signal is not transferred to the specific location and specific device – it is merely created and “pushed” in the general direction. It is obvious that any signal is a vibration and therefore also a frequency. This means that your TV antenna or satellite dish are “listening” to vibrations in space and depending on the type of vibration they register, they react in a certain way. It is only then that we get what we call “picture”.

People, similarly, have certain types of reactions to certain vibrations. For example, you enter a room that is cold. This space is vibrating with chilling atmosphere, whether you willingly react to it or not. Trembling is a perfectly normal reaction to the vibration of that space. So, we could say that “your phone number” responds to a vibration in the space, because your consciousness is able to receive that type of vibrating sequence. If there were another person in the room, “a different phone number”, maybe it would not react to this vibration.

There are a lot of different processes happening inside you: your heart is beating, your liver is working, blood is flowing, your lungs are expanding and contracting etc. All of this reflects as a vibration in space. Just imagine how many frequencies you have inside you right now. It is enough for someone to just look at you and you are already influencing them. With your eyes, you are able to see even the Sun, a tremendously distant object. The fact is that, the communication between you and the other object is the most natural thing. Does this mean that “your phone number” reacts to a glass that is in your room right now? And does this glass react to a vibration of a TV in the same room? Yes, it does. Both the glass and the TV are components of the same space. This glass is surely reacting to everything what is going on and existing here; it cannot avoid reaction. It is just that we don’t see its reaction and it does not see itself reacting. It is the same with your body, which reacts right constantly to a presence of billions of frequencies, even those completely invisible to the naked eye. It is unavoidable – if you find yourself in some space, you have to register everything going on in that space.

All the objects and subjects in one space are connected and react to each other, and these interactions are creating the vibration of the space. Distance

between them is irrelevant because the entire space is vibrating. The distance between two people is also irrelevant – one receives signals of the other and vice versa. Maybe they are still not resonating because they are not tuned to each other, but the influence exists.

What does this “ability” give us? It gives us a possibility to register any signal in space and to form a signal someone else could register. In order to form a signal for a specific person or being, we need to know its parameters of registration. You will learn how to do it on this level; this was the theory part.
